#### summary

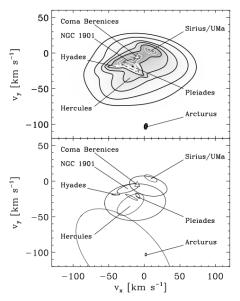

- (sensibly) I propose a definition of catalog-entry uncertainty.
- ► (radically) I recommend a *sampling* of *Gaia* Catalogs.
- (insanely) I recommend
- These suggestions are motivated by scientific considerations.

# Cosmology with Gaia

- The Milky Way is the best place to study dark matter at small scales and in the nonlinear regime.
- If dark matter annihilation is tentatively detected, can we confirm non-trivialities through dynamical tests?
- We expect *extremely rich structure* in the Galaxy's dark sector; if there is no annihilation signal, dynamics is our *only tool*.
  - think: informative, coherent phase-space structure
  - think: dynamical memory of encounters and perturbations

 Precise experiments must be done probabilistically (that is, with likelihoods or worse).

Bovy, Hogg, & Roweis 2009 ApJ 700 1794-1819

### Extreme deconvolution

- Estimating a distribution function given noisy observations?
- Every data point has its own special error properties.
- Every data point can be missing some dimensions.
- Want the distribution function that maximizes the probability of each data point, when convolved with each data point's unique uncertainty properties.
  - note frequentism?
- The best possible method, but it needs good uncertainty estimates.
  - Bovy, Hogg, & Roweis, arXiv:0905.2979
  - http://code.google.com/p/extreme-deconvolution/

Bovy 2010 arXiv:1006.0736

# Stream-finding

- In phase space, clusters evolve to (finite-thickness) one-dimensional lines.
  - three conserved quantities—actions
  - two unexplored directions in angle space
- Gaia will find thousands of these, by any estimate.
- ► The faintest require a multi-star hypothesis test for validation.
  - A small covariance (in, say, the radial velocities) can dominate this hypothesis test once there are many stars being tested simultaneously.

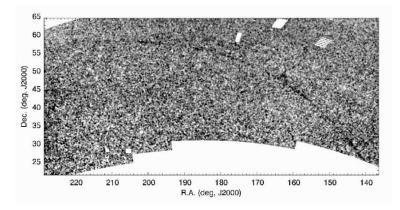

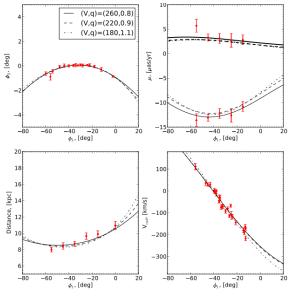

Fig. 1.— Smoothed, summed weight image of the SDSS field after subtraction of a low-order polynomial surface fit. Darker areas indicate higher surface densities. The weight image has been smoothed with a Gaussian kernel with  $\sigma = 0.2^{\circ}$ . The white areas are either missing data, or clusters, or bright stars which have been masked out prior to analysis.

Koposov, Rix, & Hogg, 2010 ApJ 712 260-273.

# Full Milky-Way modeling

- Generate models of the observed distribution of stars given a dynamical model and a distribution function.
- Comparison of models is by necessity a full-Catalog (or nearly so) multi-star hypothesis test.

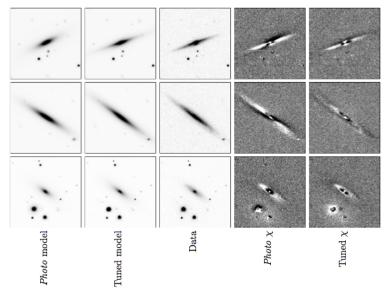

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

### Polemic: Telescopes do not generate catalogs

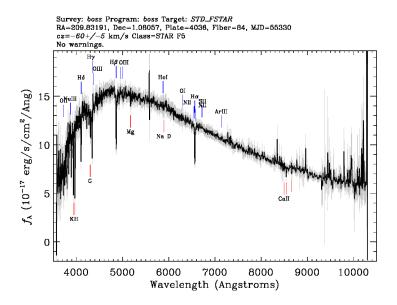

- ... they generate intensity measurements!
- ▶ We want to test models against the intensity measurements.

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- A well-designed catalog permits this.

### Spectro-perfectionism

- an *SDSS-III* spectrum:  $\lambda_i, f_i, 1/\sigma_i^2$
- These are not (just) measurements of flux with standard errors!
- two models:  $m_1(\lambda)$ ,  $m_2(\lambda)$

define

$$\Delta \chi^2 \equiv \sum_i \left[ \frac{m_2(\lambda_i) - f_i}{\sigma_i^2} \right] - \sum_i \left[ \frac{m_1(\lambda_i) - f_i}{\sigma_i^2} \right]$$

- Define f<sub>i</sub>, 1/σ<sub>i</sub><sup>2</sup> so that this is as close as possible to what you would have computed for Δχ<sup>2</sup> in the read-out spectrograph image pixels.
  - Bolton & Schlegel, arXiv:0911.2689
- outputs are *parameters* of a Gaussian approximation to the likelihood function!

## Sensible proposal: Uncertainty definition

- ► a Gaia catalog entry:  $\mathbf{y}^{\mathsf{T}} = [RA, Dec, \pi, \mu_{\alpha}, \mu_{\delta}, v_r], \mathbf{C}^{-1}$
- ► Two hypotheses: **Y**<sub>1</sub>, **Y**<sub>2</sub>
- define

$$\Delta \chi^2 \equiv \left[ \mathbf{Y}_2 - \mathbf{y} \right]^{\mathsf{T}} \cdot \mathbf{C}^{-1} \cdot \left[ \mathbf{Y}_2 - \mathbf{y} \right] - \left[ \mathbf{Y}_1 - \mathbf{y} \right]^{\mathsf{T}} \cdot \mathbf{C}^{-1} \cdot \left[ \mathbf{Y}_1 - \mathbf{y} \right]$$

Define  $\mathbf{y}, \mathbf{C}^{-1}$  so that this is as close as possible to what you would have computed for  $\Delta \chi^2$  in the *telemetered image pixels*, marginalizing over all nuisance parameters.

- a marginalized likelihood?
- see hierarchical Bayes literature
- Gelman et al., Bayesian Data Analysis (Chapman & Hall)

## Polemic: Publish likelihoods, not posteriors!

- Yes, Bayes's rule is the right way to do inference, but:
- Data enter inference through the likelihood.
- Different users have different priors (because they have different data).
- Subsequent users want to combine (say) three datasets without *cubing* the prior.
- Even if you *insist* on publishing posteriors, *also* publish the prior, so subsequent users can divide it out.

## Radical proposal: A sampling of Gaia Catalogs

- Make not one *Gaia* Catalog but K + 1.
- ► The "zeroth" Catalog is your principal release.
- The other K are samples from a posterior distribution, with
  - astrometric catalog entry variations, and
  - calibration nuisance parameter variations
- such that an average of any quantity over K samples is close to a marginalization over all probabilistic quantities.

- ► This is equivalent to a rank-K approximation of the covariance matrix
  - ► cf. Holl contribution

Radical proposal: Permit qualitative changes

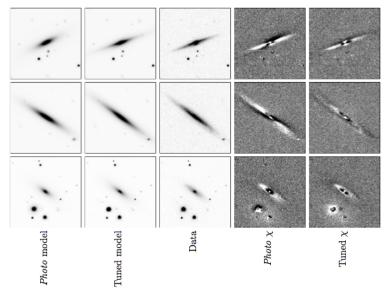

There is no need to make hard decisions even about qualitatively different models.

- ▶ 0, 1, or N expolanets?
- binary star?
- return sampling for each possibility, plus likelihoods
- empowers users:
  - different users have different priors
  - different users have different utilities
  - different users have different data (which they want to combine with Gaia data optimally)

## Insane proposal: Expose the likelihood function

- Input: (catalog, nuisance-parameter) diff
- ▶ Output:  $\Delta \log \mathscr{L}$ 
  - permits any user to compute any element of the full covariance

- could shift computational burden to users
- challenging now; easy in 2020
- annoyed? hey, talk is cheap!

Lang, Hogg & Peng, NIPS submitted

#### summary

- ► (sensibly) I propose a definition of catalog-entry *uncertainty*.
- (radically) I recommend a sampling of Gaia Catalogs.
- (insanely) I recommend exposing the likelihood function.
- These suggestions are motivated by scientific considerations.
