Abstract

This is the Gaia DPAC Software Design Description (SDD) for DU 438, which aims at providing the simulated test data for all the other Non-Single Stars (NSS) Development Units (DU).

Software Design Document 4
1 Introduction

1.1 Objectives

The DU438 intends to provide (realistic) simulated data to the other NSS DUs. For that purpose, it relies on the work performed within the CU2 GaiaSimu toolbox (Babusiaux et al., [FC-001]) on one hand, to generate source data, and on the GOG (Isasi et al., [YI-003]) or GIBIS (Babusiaux et al., [CB-003]) generators in a second step for the generation of the transit data.

The software developed in DU438 thus relies on the GaiaSimu library to provide an adaptation to the NSS needs. Besides, DU438 also collects the requirements from the NSS DUs for an implementation within GaiaSimu.

1.2 Scope

This document is applicable to this software product and provides a minimum information only about the product. More information about the scientific content can be found in Arenou (DMS-FA-003) and more recently in Arenou (2009a). How to install the product is described in (Arenou, 2009b) and how to run it is shown in (Arenou, 2008b). The rest of the information is indicated through references in the text, pointing to URL links.

1.3 Applicable Documents

Levoir et al. (TL-001) DPAC Product Assurance Plan
Pourbaix et al. (DP-005) Software Development Plan for CU4
CU4 (DP-006) Software Requirements Specification for CU4
Arenou (2008a) Software Requirements Specification for product: Simulated Test Data for Non Single Stars processing

**Description:** This software product aims at producing lists of simulated sources specifically adapted to each DU NSS needs.

**Dependencies:** This software product needs the GaiaSimu archive to work. It is made of a jar and of external data files; for details about the full dependencies, and how to implement them, please refer to the DU438 Software Release Note (Arenou, 2009b).

3.2 Architecture

The general organisation is the described at section 4.1.2. Besides, as most of the methods have been implemented as much as possible by default in the Universe part of GaiaSimu, the general organisation of the GaiaSimu software also needs to be described. This is done in the Universe Model SDD (Robin et al., AR-006), Sect. 4.1, to which the reader is referred.

3.3 Dynamic description

The DU438 is run as described in its Software User Manual (Arenou, 2008b). In summary, the description is the following: the user chooses to which NSS DU the data will be simulated (choice is DU432, DU433, DU434, DU436, DU437, DU439, and DMS for the general Universe Model default), and possibly:

- how many sources should be simulated,
- and in this case, possibly up to which limiting magnitude,
- and in this case, possibly up to which distance.

From this, a list of random sources pertaining to multiple systems is output. This list should then be submitted to GOG/GBIS for the generation of the transit data.
4 Software Modules

4.1 DU438

4.1.1 Identification

| Identifier: | DU438 |
| Type:       | Java Package |
| Purpose:    | CU4-DU438-S-FUNC-020, CU4-DU438-S-FUNC-030, CU4-DU438-S-FUNC-040 |
| Description:| This software module implements the generation of simulated sources |
| Dependencies:| see [3.1] |

4.1.2 Static Description

The DU438 is organised in two parts:

- the DU438 launch environment (DU438, DU438Main, DU438Exception classes)
- the DmsSimuDU43\(n\) \((n = 2, 3, 4, 6, 7, 9)\) classes inside the current_cycle folder.

The classes are shown Fig. 1. The various DmsSimuDU43\(n\) only contain the same public methods, and, as much as possible, all what can be deported to the DmsCommon GaiaSimu class is done, trying to leave only what is special in the DmsSimuDU43\(n\).

4.1.3 Dynamic Description

When DU438Main is launched, and after the environment is settled (output files, etc), the sources are generated. For DU433, which uses GIBIS, this is done in one \((l, b)\) direction. For the other, this is done in several galactic areas to allow mixed statistical properties.

In each direction, the GaiaSimu getSources() method is called, which generates a list of stellar sources. These sources can be chosen at random as single or multiple systems, and of course they are systematically binary (and sometimes multiple) in our DU43\(n\) cases. This is through the getSources() that the DmsSimuDU43\(n\) are called, substituting the GaiaSimu standard DmsGenerator class. They contain the basic recipe to generate the style of binary system, choosing the period range, etc.
4.1.4 Interfaces

The generated data strictly follows the Universe Model Interface Control Document (Reyle et al. CR-001). Please refer to this UM ICD document for all details: the output format is not repeated here to avoid any mistake.
5 Traceability

</tbody>
</table>

The field completion reveals whether the SRS requirement is fully covered. It can have the following values:

- **C**: the SRS requirement is fully covered
- **PC**: the SRS requirement is partially covered
- **NC**: the SRS requirement is not covered at all

The values **PC** and **NC** could happen when the CU/DU decide for example to delay the design of all or part of a functionality to the next cycle.
